## 2. INTRODUCTION

A communication protocol is working as BUS transmitting and receiving information between master and slave nodes. It is a 'single master, multiple slaves' bus with one wire, where a master starts all transmissions and only one selected slave answers the requested information. The communication will always be half duplex. Periodically, the master has the bus control, transmits a communication frame towards one of the nodes, and waits to receive an answer. The slaves only reply messages from the master. They do not start a communication unless they receive a frame from the master.

In this application, the master is a machine control and the slave should be an inverter

## 3. TRANSMISSION PARAMETERS

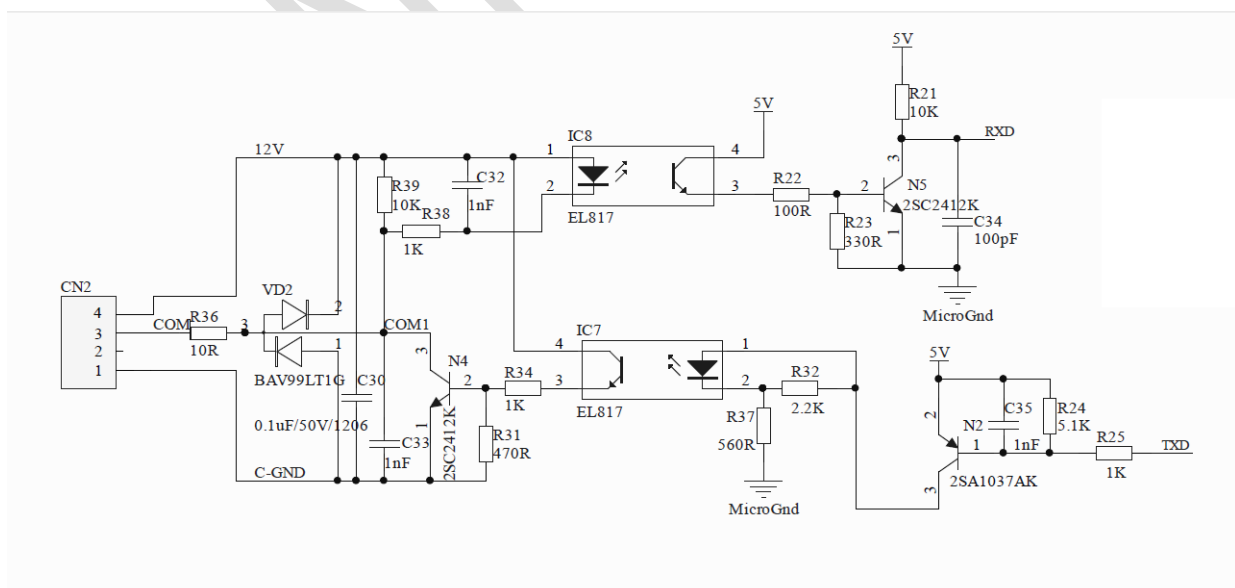

### Communication connector

Inverter part

| Pin | Definition      |
|-----|-----------------|
| 1   | GND             |
| 2   | <i>Reserved</i> |
| 3   | Data (TX/RX)    |
| 4   | VCC             |

### Typical circuit

Inverter part

|  |                                   |  |
|--|-----------------------------------|--|

|  | Nidec Motor (Qingdao) Corporation |  |

|                            |                  |
|----------------------------|------------------|
| Communication type         | Asynchronous     |
| Start Byte Transmission    | One start bit    |
| Stop Byte Transmission     | One stop bit     |
| Bit Check                  | Odd parity       |
| Number of information bits | 8                |
| Bits order                 | LSB first        |
| Communication              | Half duplex      |
| Baud Rate                  | 4800             |
| Checksum                   | CRC <sup>@</sup> |

**Note:** @ A XOR result of all frame bytes.

## 4. GENERIC FRAME DEFINITION

### 4.1 Machine control to inverter

| Byte1  | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 | Byte8 | Byte9 | Byte10 | Byte11                          |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|--------|---------------------------------|
| Header | Mode  |       |       |       |       |       |       |       |        | CRC check byte                  |
| A5     |       |       |       |       |       |       |       |       |        | <i>A XOR of all frame bytes</i> |

The frame length is fixed and be 11 bytes (includes CRC byte)

Header: 10100101 (Hex A5)

Mode: refer to “[5. TYPES OF FRAME](#)”

CRC check byte: A XOR of all frame bytes

### 4.2 Inverter to machine control

| Byte1     | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7                           |
|-----------|-------|-------|-------|-------|-------|---------------------------------|
| Header    | Mode  |       |       |       |       | CRC check byte                  |
| A5 (or5A) |       |       |       |       |       | <i>A XOR of all frame bytes</i> |

The frame length is fixed and be 7 bytes (includes CRC byte)

Header: 10100101 (Hex A5), or 01011010 (Hex 5A) as NACK

Mode: refer to “[5. TYPES OF FRAME](#)”

CRC check byte: A XOR of all frame bytes

|   |                                   |  |
|---|-----------------------------------|--|

## 5. TYPES OF FRAME

| Item | Command                            | Description                                  | Mode |
|------|------------------------------------|--|------|
| 1    | <b>Ping</b>                        | Set up washer type                           | 0x02 |
| 2    | <b>Request</b>                     | Polling motor onsite                         | 0x05 |
| 3    | <b>CW rotation</b>                 | CW drive motor                               | 0x09 |
| 4    | <b>CCW rotation</b>                | CCW drive motor                              | 0x0B |
| 5    | <b>Agitation</b>                   | Wash tumble pattern                          | 0x0C |
| 6    | <b>Spin</b>                        | Set specific speed as target                 | 0x0D |
| 7    | <b>Stop</b>                        | Stop motor to 0 speed                        | 0x27 |
| 8    | <b>Brake</b>                       | Brake motor to 0 speed quickly               | 0x29 |
| 9    | <b>Voltage detection</b>           | Request DC bus voltage                       | 0x2B |
| 10   | <b>Weight detection enable</b>     | Enable load weight detection                 | 0x2C |
| 11   | <b>Fabric detection enable</b>     | Enable load fabric type detection            | 0x2D |
| 12   | <b>Clutching - declutching</b>     | Slowly turn on motor in CW and CCW direction | 0x19 |
| 13   | <b>Enable/Disable Forced brake</b> | Force motor to stop in any situation         | 0x1B |
| 14   | <b>Motor free shaft spin</b>       | Motor spin without machine's basket          | 0x1D |
| 15   | <b>FCT test</b>                    | FCT test Nidec inverter manufacturing        | 0x66 |

### 5.1 Ping command

Ping command intends to tell inverter the washer type of motor working with. Should be sent to inverter after power up every time before letting motor to work.

Platform is the related parameter. It can be a washer volume data as distinguishable parameter. For example, 6kg, 7kg, 8kg, etc. Corresponding platform should be 0x06, 0x07, 0x08, etc.

Empty raw weight data is this washer's empty basket raw weight data. If this data is 0, inverter will not do any adjustment on gotten weight raw data in weight detection process. If this data is not 0, inverter will adjust weight raw data by adding delta between this data and original table's empty basket raw data. This adding data maybe positive or negative.

|    |    |          |                                 |                                |    |    |    |    |    |     |
|----|----|----------|---------------------------------|--------------------------------|----|----|----|----|----|-----|
| A5 | 02 | Platform | Empty raw weight data High byte | Empty raw weight data Low byte | 00 | 00 | 00 | 00 | 00 | CRC |
|----|----|----------|---------------------------------|--------------------------------|----|----|----|----|----|-----|

|  |                                   |  |
|--|-----------------------------------|--|
|  | Document Type                     | <b>TECHNICAL SPECIFICATION</b>             |
|  | Component                         | Washing Machine Bus Communication Protocol |
|  | Customer                          | Elaraby                                    |
|  | Nidec Motor (Qingdao) Corporation |  |

Ping ACK

|    |    |          |                          |                         |    |     |
|----|----|----------|--------------------------|-------------------------|----|-----|
| A5 | 02 | Platform | Version number High Byte | Version number Low Byte | 00 | CRC |
|----|----|----------|--------------------------|-------------------------|----|-----|

## 5.2 Request command

Request command is for holding communication continuous as a filling while no special command needs to be sent. Should be sent every one second at least. Since there is a communication fault handling, the fault will be reported while no communication for 6 seconds.

|    |    |    |    |    |    |    |    |    |    |     |
|----|----|----|----|----|----|----|----|----|----|-----|
| A5 | 05 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | CRC |
|----|----|----|----|----|----|----|----|----|----|-----|

Request ACK

|    |    |       |                              |                             |                      |     |
|----|----|-------|------------------------------|-----------------------------|----------------------|-----|
| A5 | 05 | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | Weight Value (*100g) | CRC |
|----|----|-------|------------------------------|-----------------------------|----------------------|-----|

*If Weight Value has not detected, report 0*

## 5.3 CW rotation command

CW rotation command intends to drive motor running in a clockwise direction at specific motor speed.

|    |    |                       |                      |                               |                              |    |    |    |    |     |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|
| A5 | 09 | Motor Speed High byte | Motor Speed Low byte | Time Accel High byte (*100ms) | Time Accel Low byte (*100ms) | 00 | 00 | 00 | 00 | CRC |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|

CW ACK

|    |    |       |                              |                             |    |     |
|----|----|-------|------------------------------|-----------------------------|----|-----|
| A5 | 09 | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | 00 | CRC |
|----|----|-------|------------------------------|-----------------------------|----|-----|

|  |                                   |  |
|--|-----------------------------------|--|
|  | Document Type                     | <b>TECHNICAL SPECIFICATION</b>             |
|  | Component                         | Washing Machine Bus Communication Protocol |
|  | Customer                          | Elaraby                                    |
|  | Nidec Motor (Qingdao) Corporation |  |

#### 5.4 CCW rotation command

CCW rotation command intends to drive motor running in a counter clockwise direction at specific motor speed.

|    |    |                       |                      |                               |                              |    |    |    |    |     |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|
| A5 | 0B | Motor Speed High byte | Motor Speed Low byte | Time Accel High byte (*100ms) | Time Accel Low byte (*100ms) | 00 | 00 | 00 | 00 | CRC |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|

CCW ACK

|    |    |       |                              |                             |    |     |
|----|----|-------|------------------------------|-----------------------------|----|-----|
| A5 | 0B | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | 00 | CRC |
|----|----|-------|------------------------------|-----------------------------|----|-----|

#### 5.5 Agitation command

Agitation command intends to drive motor running with a wash tumble pattern at specific motor speed.

|    |    |                       |                      |                     |                     |                     |                      |                      |                       |     |
|----|----|-----------------------|----------------------|---------------------|---------------------|---------------------|----------------------|----------------------|-----------------------|-----|
| A5 | 0C | Motor Speed High byte | Motor Speed Low byte | Time Accel (*100ms) | Time Decel (*100ms) | Time CW on (*100ms) | Time CW off (*100ms) | Time CCW on (*100ms) | Time CCW off (*100ms) | CRC |
|----|----|-----------------------|----------------------|---------------------|---------------------|---------------------|----------------------|----------------------|-----------------------|-----|

Agitation ACK

|    |    |       |                              |                             |    |     |
|----|----|-------|------------------------------|-----------------------------|----|-----|
| A5 | 0C | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | 00 | CRC |
|----|----|-------|------------------------------|-----------------------------|----|-----|

#### 5.6 Spin command

Spin command intends to drive motor spin with specific acceleration time at specific motor speed.

|    |    |                       |                      |                               |                              |    |    |    |    |     |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|
| A5 | 0D | Motor Speed High byte | Motor Speed Low byte | Time Accel High byte (*100ms) | Time Accel Low byte (*100ms) | 00 | 00 | 00 | 00 | CRC |
|----|----|-----------------------|----------------------|-------------------------------|------------------------------|----|----|----|----|-----|

|  |                                   |  |
|--|-----------------------------------|--|
|  | Document Type                     | <b>TECHNICAL SPECIFICATION</b>             |
|  | Component                         | Washing Machine Bus Communication Protocol |
|  | Customer                          | Elaraby                                    |
|  | Nidec Motor (Qingdao) Corporation |  |

Spin ACK

|    |    |       |                              |                             |    |     |
|----|----|-------|------------------------------|-----------------------------|----|-----|
| A5 | 0D | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | 00 | CRC |
|----|----|-------|------------------------------|-----------------------------|----|-----|

### 5.7 Stop command

Stop command intends to control motor to stop to 0 speed (close loop).

|    |    |    |    |    |    |    |    |    |    |     |
|----|----|----|----|----|----|----|----|----|----|-----|
| A5 | 27 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | CRC |
|----|----|----|----|----|----|----|----|----|----|-----|

Stop ACK

|    |    |       |                              |                             |    |     |
|----|----|-------|------------------------------|-----------------------------|----|-----|
| A5 | 27 | Error | Actual Motor Speed High byte | Actual Motor Speed Low byte | 00 | CRC |
|----|----|-------|------------------------------|-----------------------------|----|-----|

### 5.8 Brake command

Brake command intends to stop motor to 0 speed as fast as possible (open loop).

|    |    |    |    |    |    |    |    |    |    |     |
|----|----|----|----|----|----|----|----|----|----|-----|
| A5 | 29 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | 00 | CRC |
|----|----|----|----|----|----|----|----|----|----|-----|

Brake ACK

|    |    |       |                              |                             |    |     |

#### 5.10 Weight detection enable command

Weight detection enable command intends to enable motor to start weight measuring process. This process will be complete in 35 seconds usually. And needs motor working at wash status (clutch be released).

In the beginning of machine cycle running, machine control will transfer this washer's empty raw weight data to inverter by sending the ping command.

After weight measurement has finished, detected weight raw data will be adjusted according to this washer's empty raw weight data. Then calculate the linear (physical) weight data by comparing with stored raw weight table which was gotten by testing on large number of washers. The report linear weight unit is 100g.

Empty raw weight data is this washer's empty basket raw weight data. If this data is 0, inverter will not do any adjustment on gotten weight raw data in weight detection process. If this data is not 0, inverter will adjust weight raw data by adding delta between this data and original table's empty basket raw data. This adding data maybe positive or negative

|  | Customer                          | Elaraby                                    |
|  | Nidec Motor (Qingdao) Corporation |  |

### 5.12 ~~Clutching—declutching command~~

~~The clutch is in released status during wash agitation. On the contrary, the clutch is in pulled open during spin. To avoid the clutch gear working in a half clutch state, need to slowly turn the motor to make the clutch find tooth properly and can go to next step.~~

#### • **NEW tooth finding procedure:**

- ~~1. When switching from washing to spinning, the motor should rotate counter clockwise for 3 turns at a low speed (at least 1 turn, without shaking), if view from pulsator, it should be clockwise 3 turns. Then starts counterclockwise spinning.~~
- ~~2. When spinning switching to washing, firstly rotate at right direction then rotate at left direction with low speed~~

~~This change is controlled by machine control through release clutch (or pull open clutch). Therefore, machine control can send a command to inverter to do slowly turn on (CW—CCW). This behavior is called Clutching—declutching movement.~~

|    |    |                             |    |    |    |    |    |    |    |     |

### 5.13 Enable/Disable Forced brake command

Enable forced brake command intends to be able to force the motor to stop in any situation. And will hold the brake status until gets disable command to release. For example, can stop the motor immediately even if the motor is rotated by hand.

Disable forced brake command intends to release forced brake.

The byte 2 of this command if the parameter of “Enable” or “Disable”. 1 is enable and 0 is disable.

|----|----|-----------------|----------------|------------------------------|-----------------------------|--------------------|-------------------|--------------------------------|-------------------|-------------------------|------------------------|-----|

#### 5.16 NACK

All above commands are from machine control send to inverter. Inverter will ack for each receiving. If the received frame is correct, inverter will ack with accordingly ACK above. And if

|  |                                   |  |
|--|-----------------------------------|--|
|  | Document Type                     | <b>TECHNICAL SPECIFICATION</b>             |
|  | Component                         | Washing Machine Bus Communication Protocol |
|  | Customer                          | Elaraby                                    |
|  | Nidec Motor (Qingdao) Corporation |  |

the received data CRC is incorrect or mismatching, inverter should ack a NACK frame for informing.

|    |    |    |    |    |    |     |
|----|----|----|----|----|----|-----|
| 5A | 00 | FF | 00 | FF | 00 | CRC |
|----|----|----|----|----|----|-----|

#### 6. MASTER CONTROLS COMMUNICATION

Periodically, master must transmit frame data to slaves. The periodicity is not fixed, but the recommendation is 500ms (1 second at least). It is meaning, if there is not any command need to send to inverter, main control needs to send request command to inverter as a polling to make sure the communication on duty. Slaves will not reply if there is not frame. Master needs resend previous frame after 100ms did not get replay from the slave. It is meaning, main control has sent a command then changed to received mode to get inverter reply. After 100ms has not received inverter reply, main control needs to resend last command again. This repeat can last for 6 seconds. After 6 seconds master can consider a communication fault occurred if there is still not reply from inverter.

#### 7. SLAVES COMMUNICATION ERROR HANDLING

Slave is monitoring the bus all the time. If in 6 seconds does not see activity in the bus the motor will stop automatically and report communication fault to master.

#### 8. FAULT TABLE
